

Link to an instructional video on how to remove scale (calcium deposits) from shower heads

Scale can build up in nozzles when the water used is of lower quality. Such shower heads then may get clogged, which causes deformation of joints and subsequent leaking. The 26578400 shower (used in apartments) features a function to quickly remove scale. It requires certain type of maintenance. At this link, you will find a video of the manufacturer that covers this problem as well as instructions on how to maintain the showers:
